

# Operations Count and Data Locality in AD

A. Lyons (Vanderbilt U.) / J. Utke (ANL)

“Minimizing operations counts and maximizing data locality  
for efficient derivative codes in automatic differentiation”

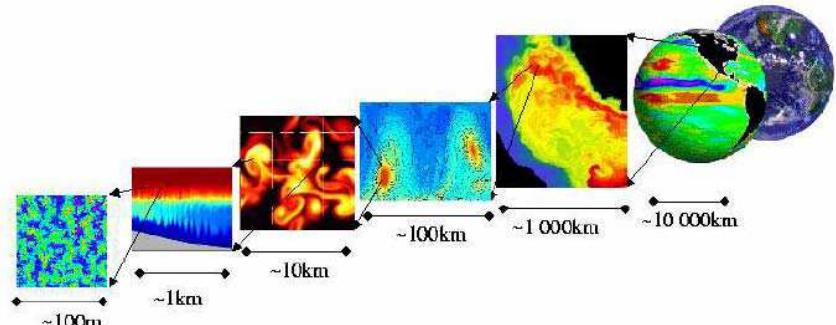

1. automatic differentiation (AD) and graphs
2. graph operations and code generation in AD
3. high level concerns (adjoints with checkpointing)
4. low level code generation has significant runtime effects
5. assumption 1: optimizing basic block preaccumulations is significant
6. assumption 2: data locality is significant
7. assumption 3: code can be generated to help compiler optimization
8.  $\Rightarrow$  heuristics
9. experiments and conclusions

bad

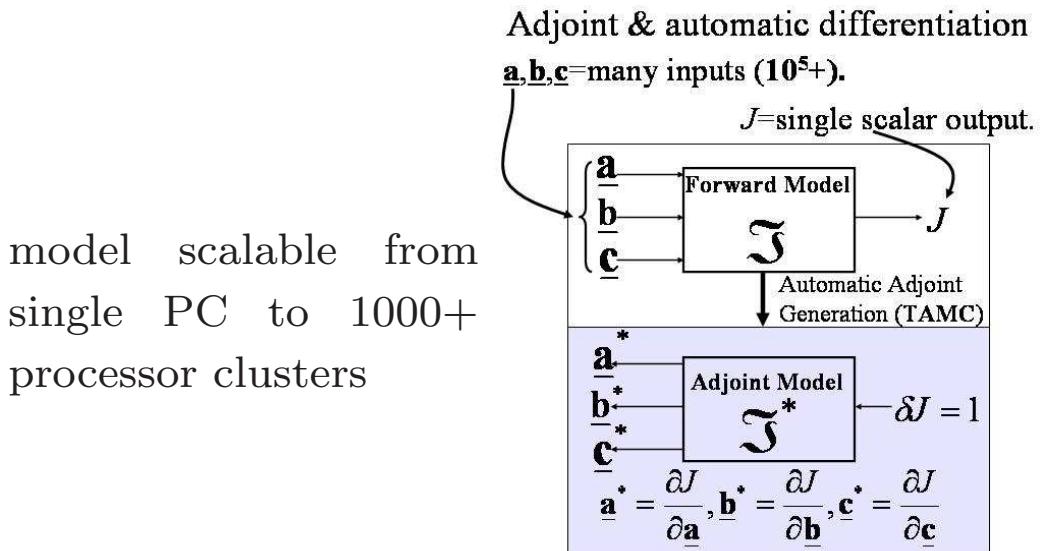

## AD in general

- derivatives for numerical models (science, engineering)
- optimization, parameter estimation, sensitivity/uncertainty analysis
- need derivative information (gradients, Jacobian/Hessian vector products)
- large scale computation
- complexity/quality issues with finite differences

MIT General Circulation Model  
(ocean,atmosphere) ©Heimbach/Hill @ MIT

model scalable from single PC to 1000+ processor clusters

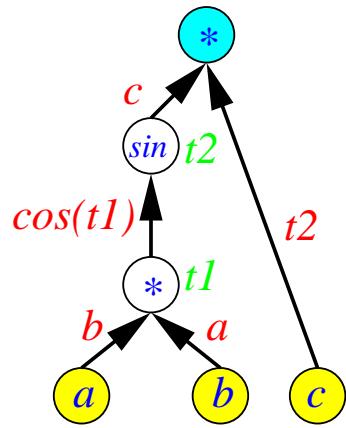

cost  $\approx \underline{4N}$

## AD and graphs: a simple example

$$f : y = \sin(a * b) * c$$

yields a graph representing the order of computation:

- use some **temporaries**  $t1, t2$
- all intrinsics  $\phi(\dots, w, \dots)$  have local partial derivatives  $\frac{\partial \phi}{\partial w}$  as edge labels:
- may have to **compute partials**

$$t1 = a * b$$

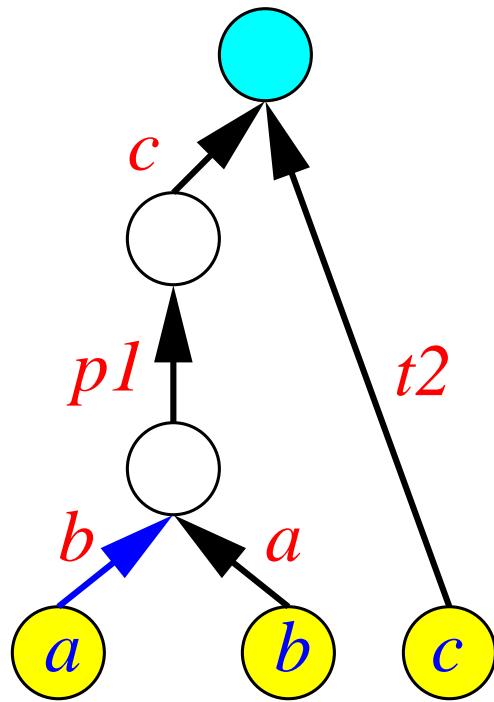

$$p1 = \cos(t1)$$

$$t2 = \sin(t1)$$

$$y = t2 * c$$

academic

## (local) Jacobians 1

edge elimination: pick an edge

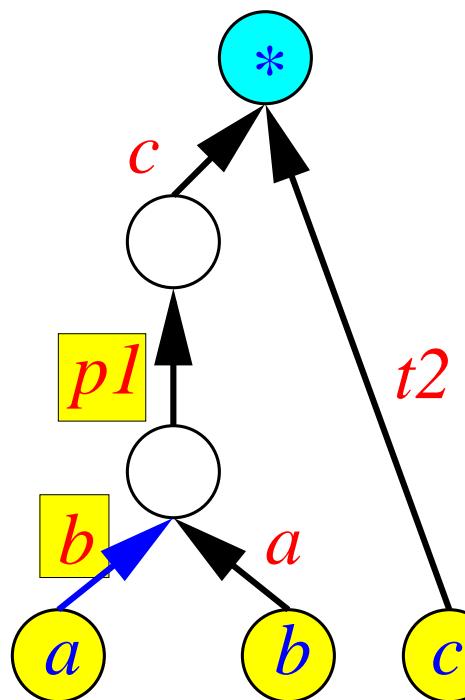

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

## (local) Jacobians 2

edge elimination: front elimination: pairs with  
outgoing edges of target vertex

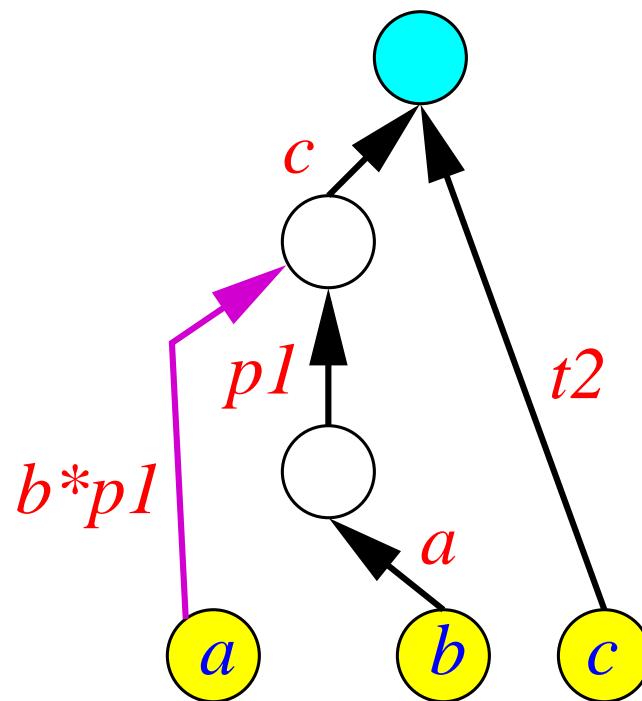

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

## (local) Jacobians 3

edge eliminations: multiply edge labels and attach to edge with same source and target of the paired edge

$$t_1 = a * b$$

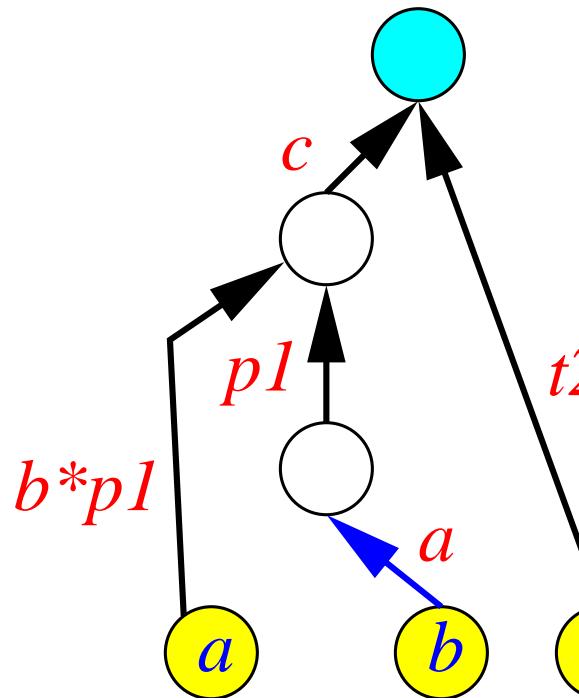

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = b * p_1$$

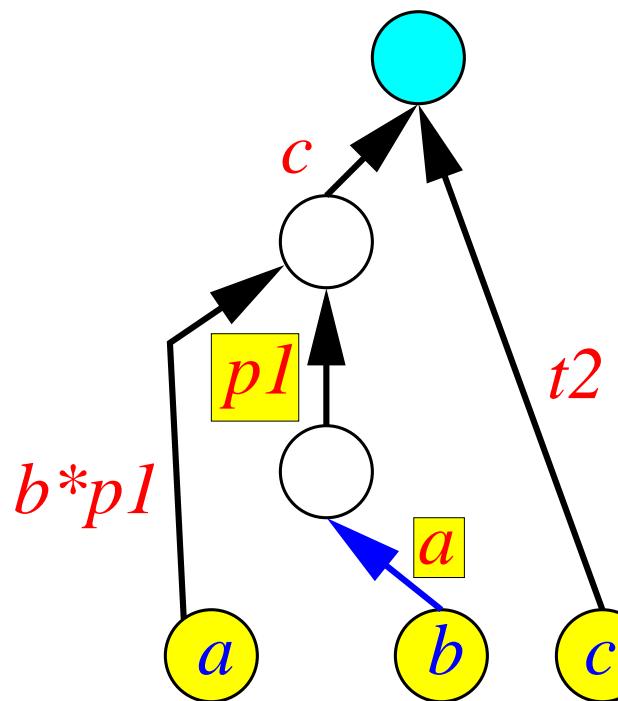

## (local) Jacobians 4

edge eliminations: pick the next target

$$\begin{aligned} t_1 &= a * b \\ p_1 &= \cos(t_1) \\ t_2 &= \sin(t_1) \\ y &= t_2 * c \\ z_1 &= b * p_1 \end{aligned}$$

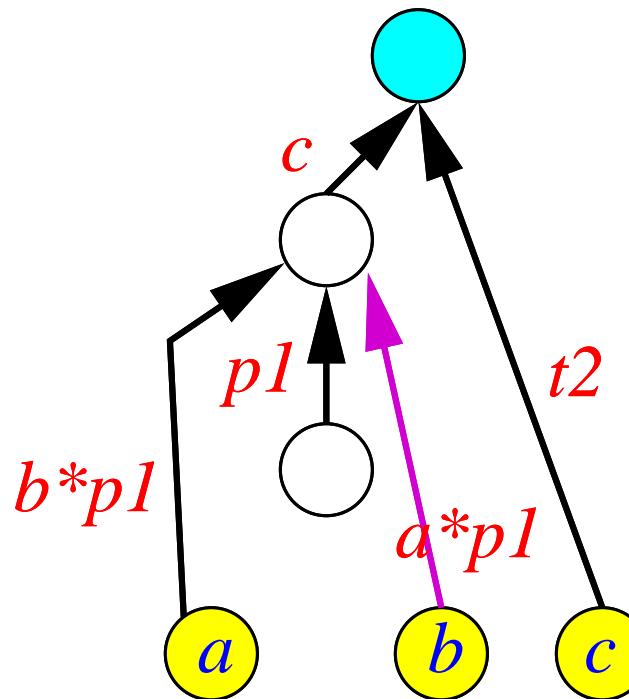

## (local) Jacobians 5

edge eliminations: pair it up with the outgoing edges of the target vertex

$$\begin{aligned} t1 &= a * b \\ p1 &= \cos(t1) \\ t2 &= \sin(t1) \\ y &= t2 * c \\ z1 &= b * p1 \end{aligned}$$

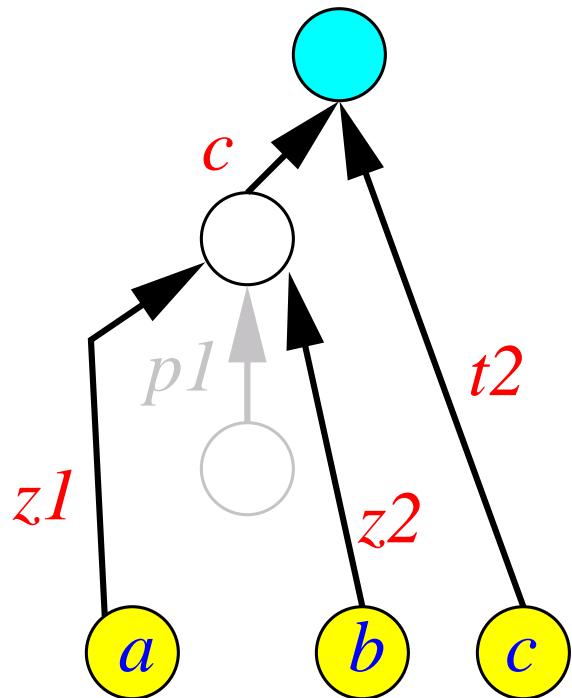

## (local) Jacobians 6

edge eliminations: multiply the labels  
and attach the result

$$\begin{aligned} t1 &= a * b \\ p1 &= \cos(t1) \\ t2 &= \sin(t1) \\ y &= t2 * c \\ z1 &= b * p1 \\ z2 &= a * p1 \end{aligned}$$

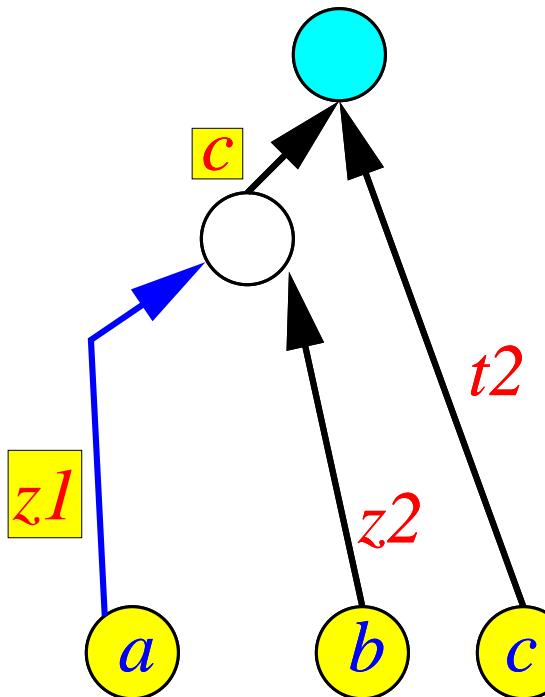

## (local) Jacobians 7

edge eliminations: there is an isolate  
vertex/edge that can be removed;  
rename edge labels

$$\begin{aligned} t1 &= a * b \\ p1 &= \cos(t1) \\ t2 &= \sin(t1) \\ y &= t2 * c \\ z1 &= b * p1 \\ z2 &= a * p1 \end{aligned}$$

## (local) Jacobians 8

edge eliminations: pick the next edge

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

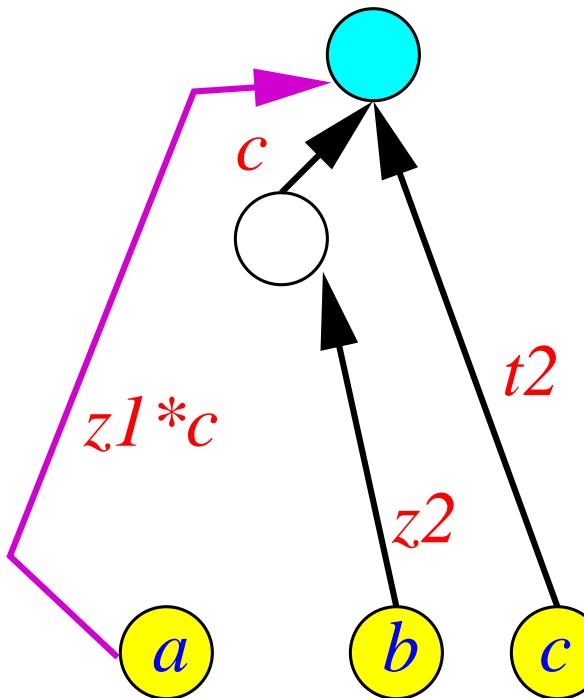

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = b * p_1$$

$$z_2 = a * p_1$$

## (local) Jacobians 9

edge eliminations: multiply labels etc.

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

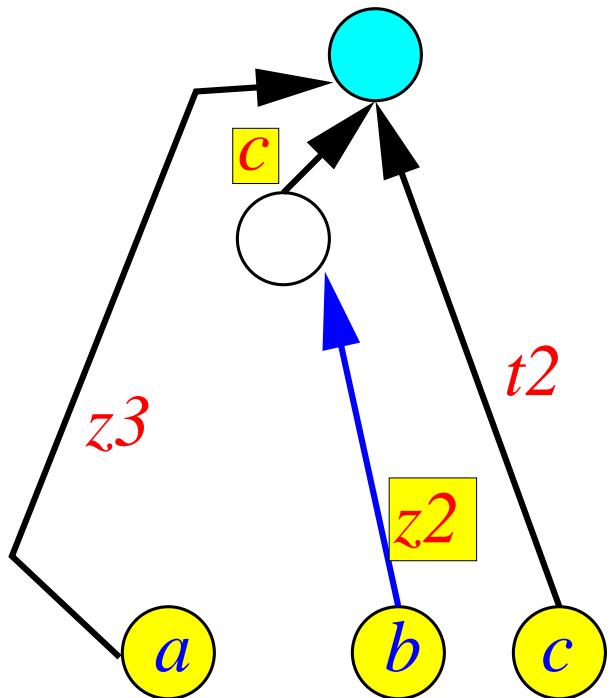

$$y = t_2 * c$$

$$z_1 = b * p_1$$

$$z_2 = a * p_1$$

$$z_3 = z_1 * c$$

## (local) Jacobians 10

edge eliminations: pick the next one

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

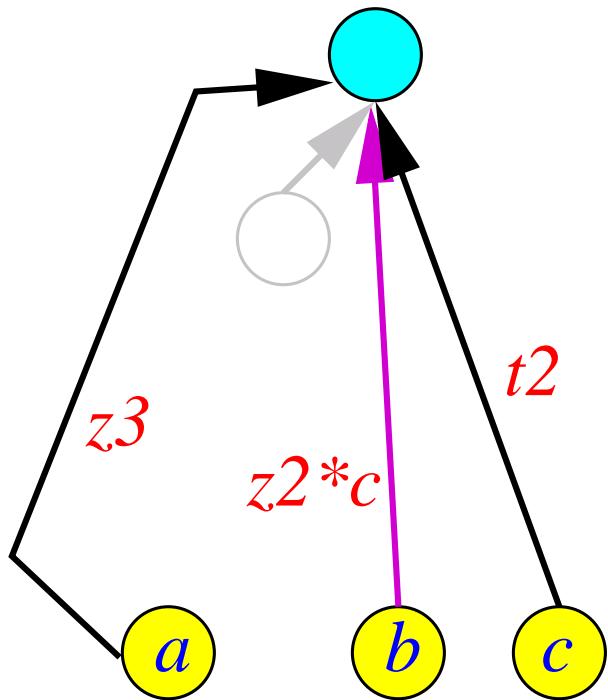

$$y = t_2 * c$$

$$z_1 = b * p_1$$

$$z_2 = a * p_1$$

$$z_3 = z_1 * c$$

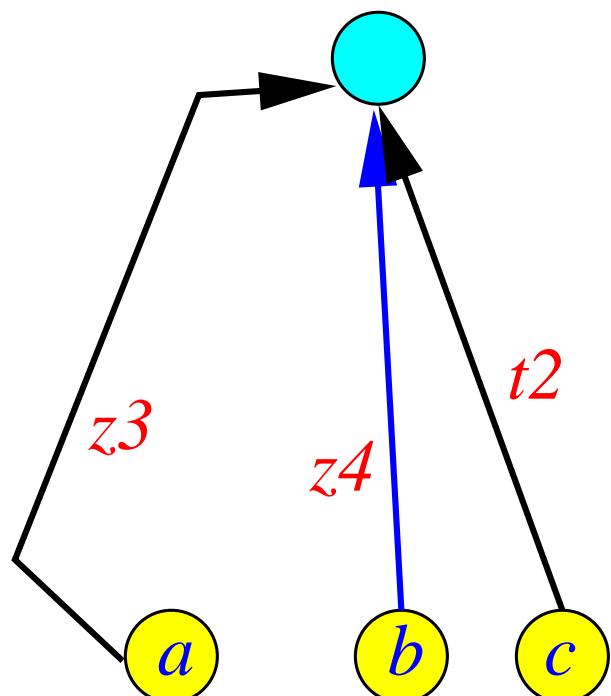

## (local) Jacobians 11

edge eliminations: multiply labels etc.

$$\begin{aligned} t1 &= a * b \\ p1 &= \cos(t1) \\ t2 &= \sin(t1) \\ y &= t2 * c \\ z1 &= b * p1 \\ z2 &= a * p1 \\ z3 &= z1 * c \\ z4 &= z2 * c \end{aligned}$$

## (local) Jacobians 12

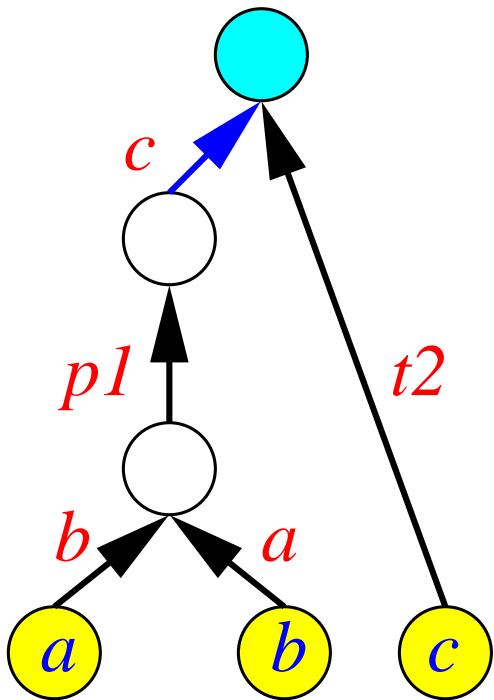

edge eliminations: bipartite graph,  
**done in 4 operations**

$$\begin{aligned} t_1 &= a * b \\ p_1 &= \cos(t_1) \\ t_2 &= \sin(t_1) \\ y &= t_2 * c \\ z_1 &= b * p_1 \\ z_2 &= a * p_1 \\ z_3 &= z_1 * c \\ z_4 &= z_2 * c \end{aligned}$$

jading

## (local) Jacobians 13

edge elimination: pick an edge

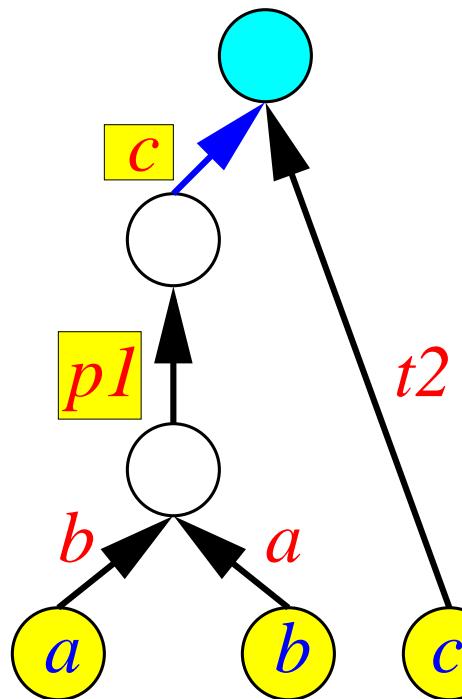

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

## (local) Jacobians 14

edge elimination: back elimination: pairs with incoming edges of source vertex

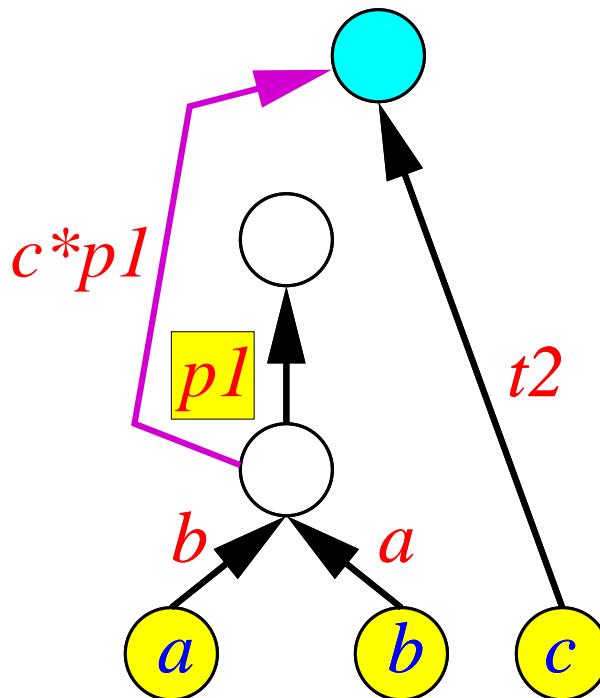

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

## (local) Jacobians 15

edge eliminations: multiply edge labels and attach to edge with same target and source of the paired edge

$$t_1 = a * b$$

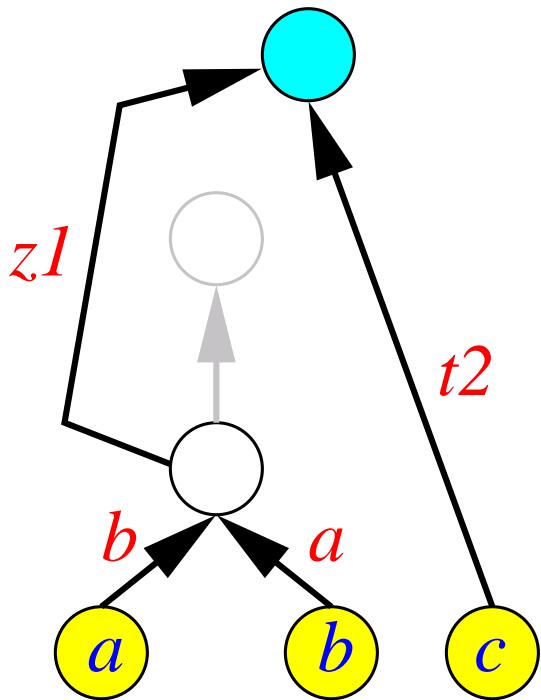

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = c * p_1$$

## (local) Jacobians 16

edge eliminations: isolated vertex/edge

$$t_1 = a * b$$

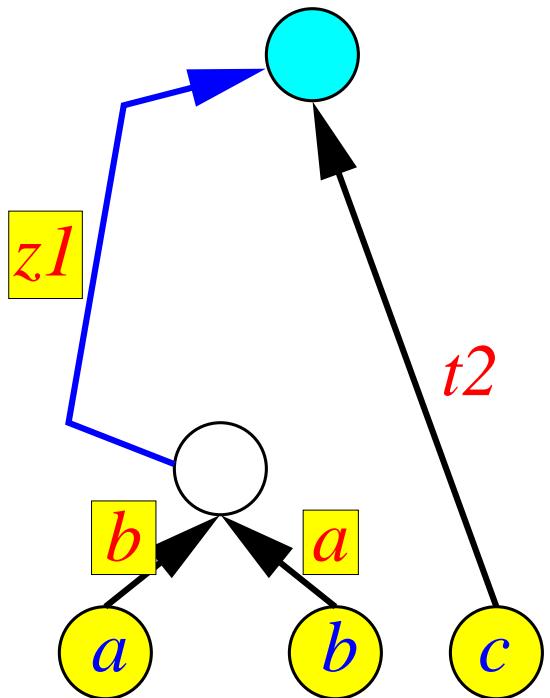

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = c * p_1$$

## (local) Jacobians 17

edge eliminations: pick the next edge

$$t_1 = a * b$$

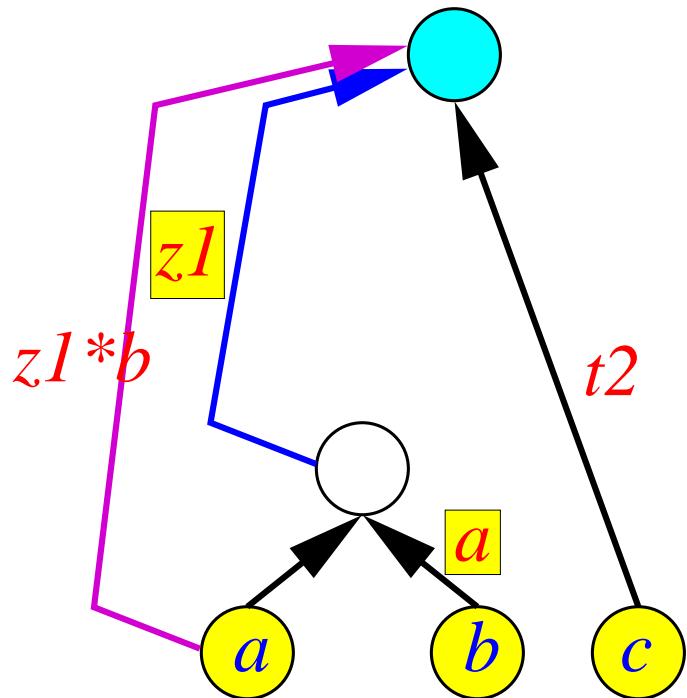

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = c * p_1$$

(local) Jacobians 18

edge eliminations: multiply edge labels  
for the first pair

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

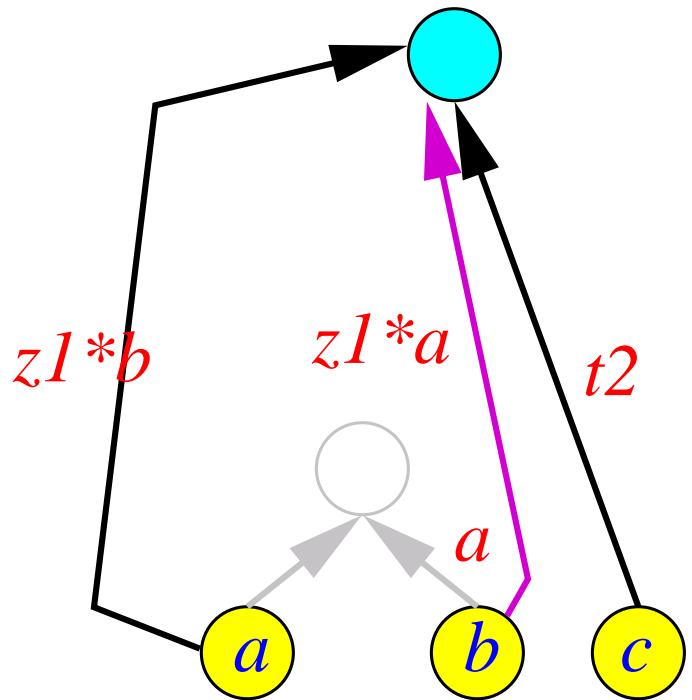

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = c * p_1$$

$$z_2 = z_1 * b$$

## (local) Jacobians 19

edge eliminations: multiply edge labels  
for the second pair

$$t1 = a * b$$

$$p1 = \cos(t1)$$

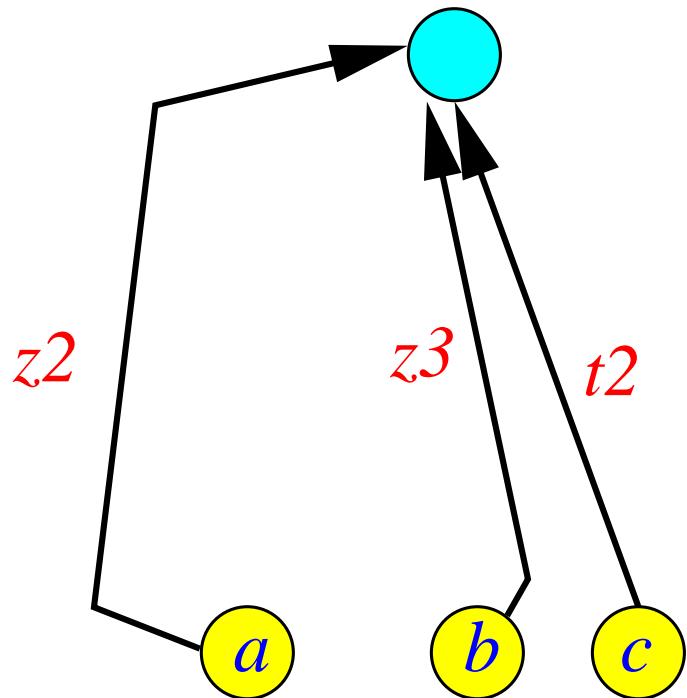

$$t2 = \sin(t1)$$

$$y = t2 * c$$

$$z1 = c * p1$$

$$z2 = z1 * b$$

$$z3 = z1 * a$$

**(local) Jacobians 20**

edge eliminations: bipartite graph,  
**done in 3 operations**

$$t_1 = a * b$$

$$p_1 = \cos(t_1)$$

$$t_2 = \sin(t_1)$$

$$y = t_2 * c$$

$$z_1 = c * p_1$$

$$z_2 = z_1 * b$$

$$z_3 = z_1 * a$$

dead

a bigger graph

## heuristics

- pick an elimination target from an eligible set  $S$
- each heuristic  $h : S \mapsto S' \subseteq S$
- heuristic sequence  $h_k(\dots h_2(h_1(S))\dots)$  with a tie-breaker  $h_k$  (such as “reverse”) returns a single elimination target
- eliminate target  $\Rightarrow$  modified graph  $\Rightarrow$  new  $S$
- done when  $S = \emptyset$
- operation count heuristics: Markowitz

## heuristics

- pick an elimination target from an eligible set  $S$
- each heuristic  $h : S \mapsto S' \subseteq S$
- heuristic sequence  $h_k(\dots h_2(h_1(S))\dots)$  with a tie-breaker  $h_k$  (such as “reverse”) returns a single elimination target
- eliminate target  $\Rightarrow$  modified graph  $\Rightarrow$  new  $S$
- done when  $S = \emptyset$
- operation count heuristics: Markowitz

Harry Max Markowitz, b. 1927, economics NP 1990,

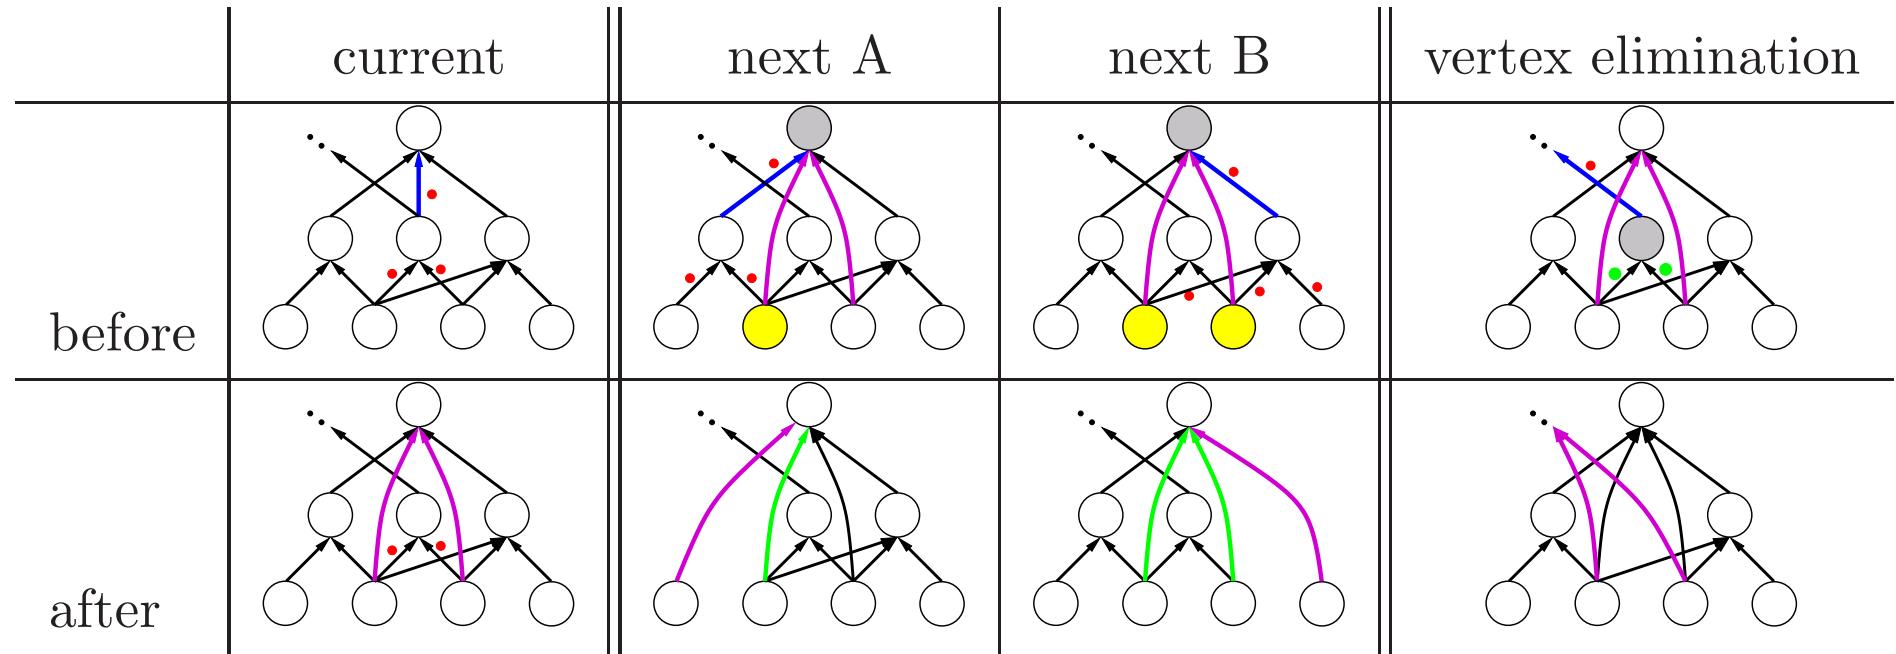

*“Becoming an economist was not a childhood dream of mine.”*

- data locality: forward, reverse, sibling(s), pc, absorb
- forward (top sort): first mark all minimal vertices, mark vertices with all pred. marked (order based on undelying graph representation)
- reverse: reverse of forward

## sibling heuristics

relate subsequent elimination target with respect to the variables occurring in the current elimination step:

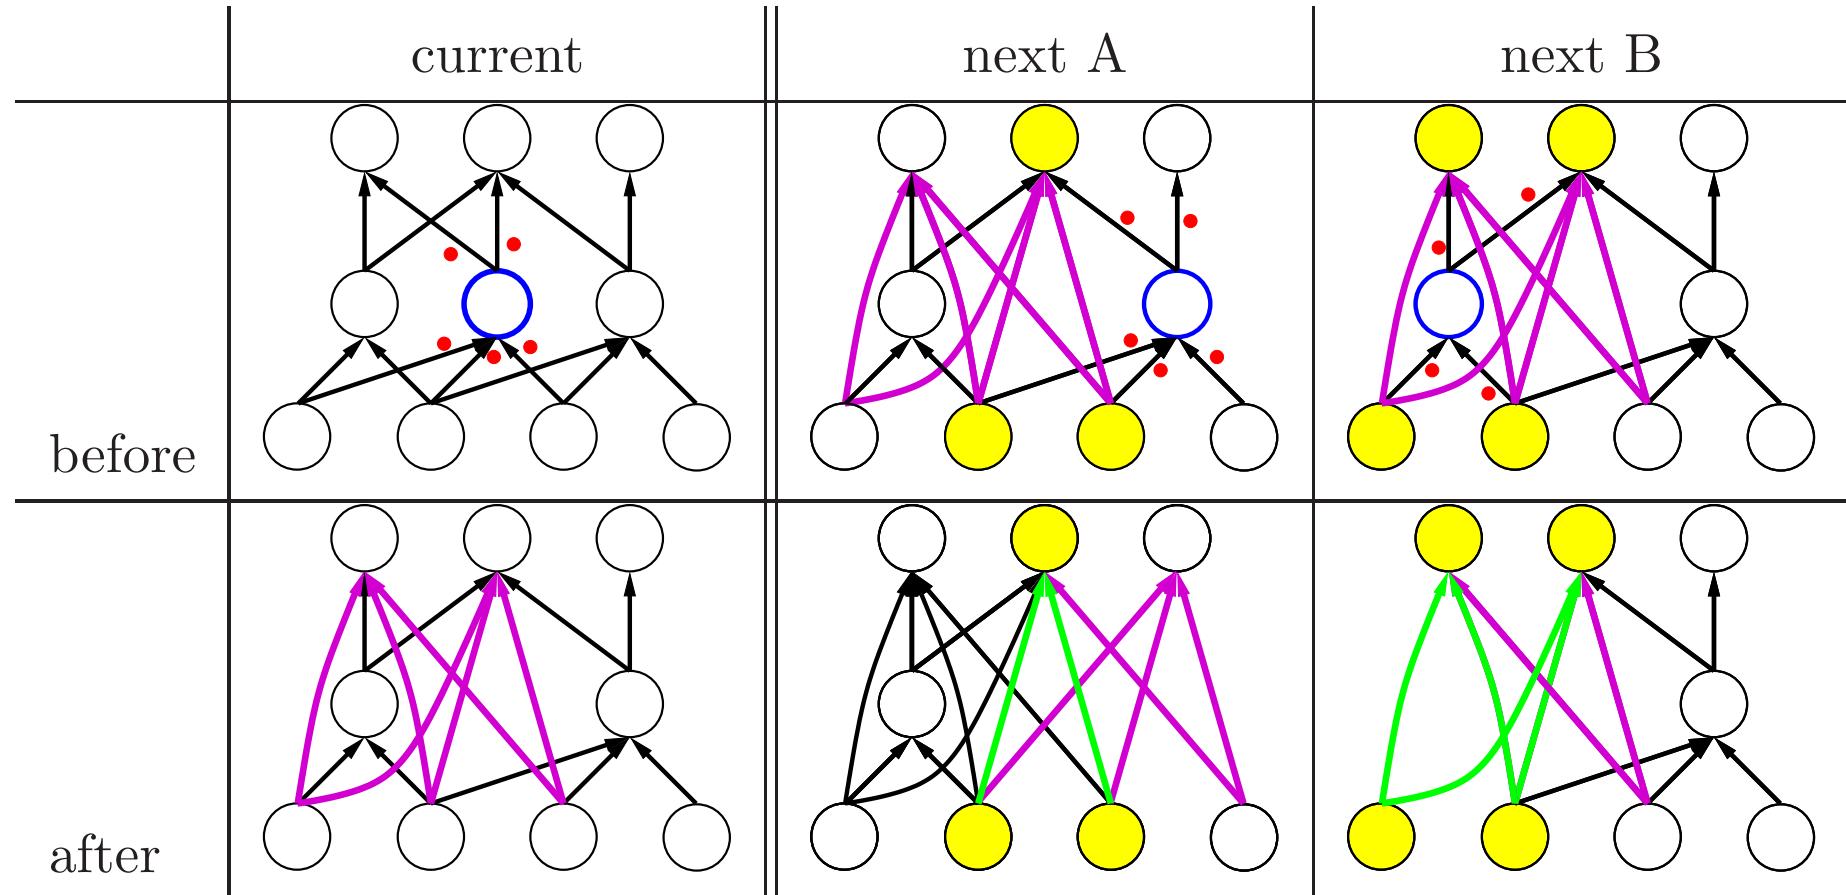

- same target, max number of source's predecessors, or
- same source, max number of target's successors

dreadful

## sibling heuristics 2

for edge eliminations grouped into vertex eliminations (target is a vertex):

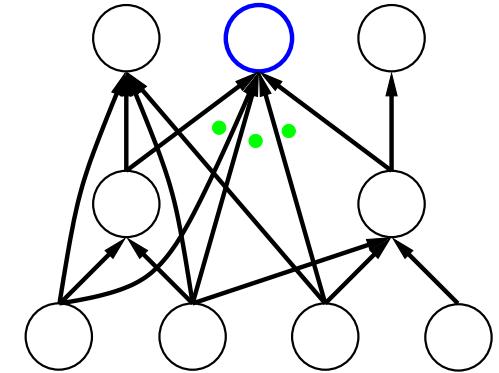

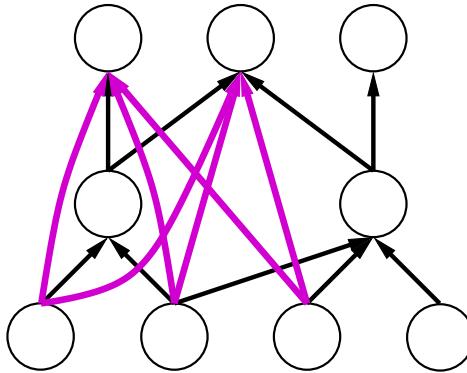

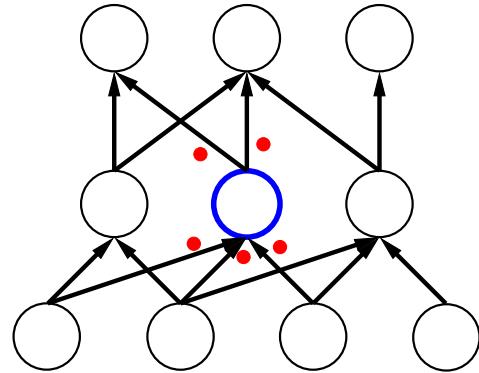

- max product of shared predecessors and successors

**pc – vertex**

- does not mean “nouvelle orthodoxie”

(politically correct translation of political correctness  
purportedly given by the *Office Québécois de la Langue Française* )

- parent-child (or the other way round)

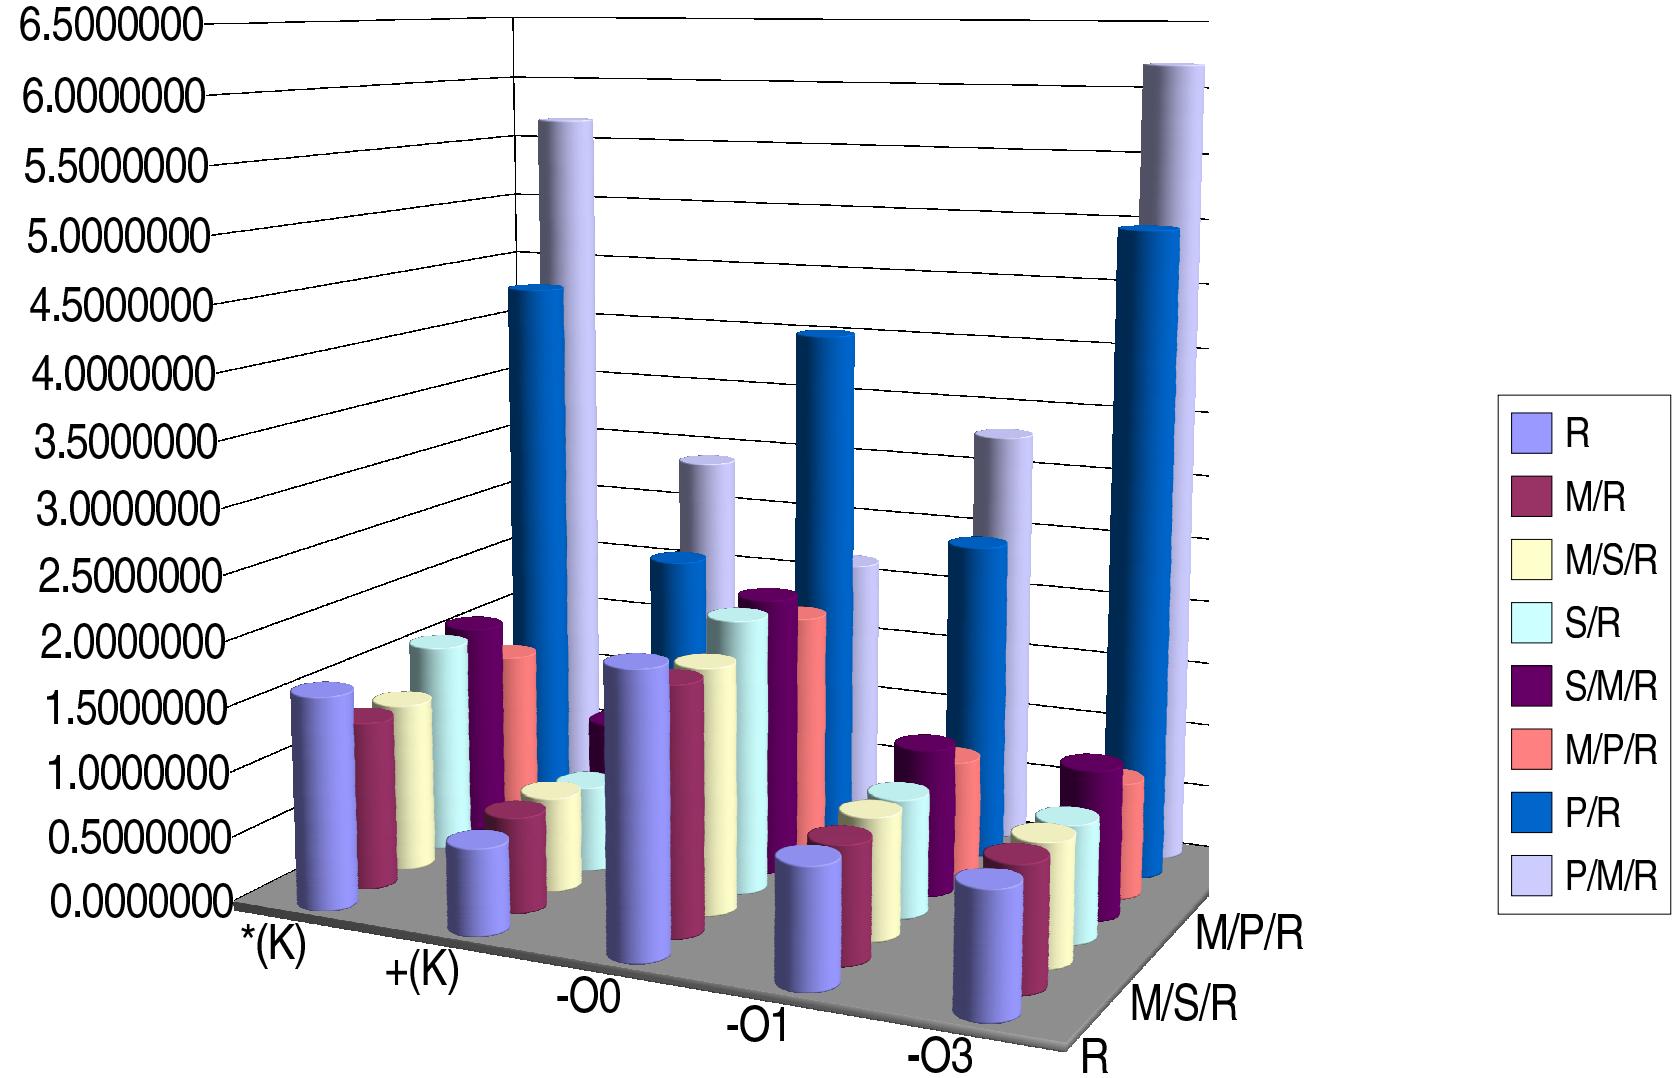

- but prefers targets with high Markowitz degree  $\Rightarrow$  sequence after Markowitz

malady

**absorb 1**

- pick elimination targets such that absorption happens
- J. Pryce (Nov/04): regroup operations  
 $a = a + bc$ ;  $e = e + fg$ ;  $h = h + ij$ ;  $a = a + kl$ ;  $m = m + no$ ;  $a = a + pq$   
based on the absorbing  $a$  to  $a = a + bc + kl + pq$
- not representable in the computational graph

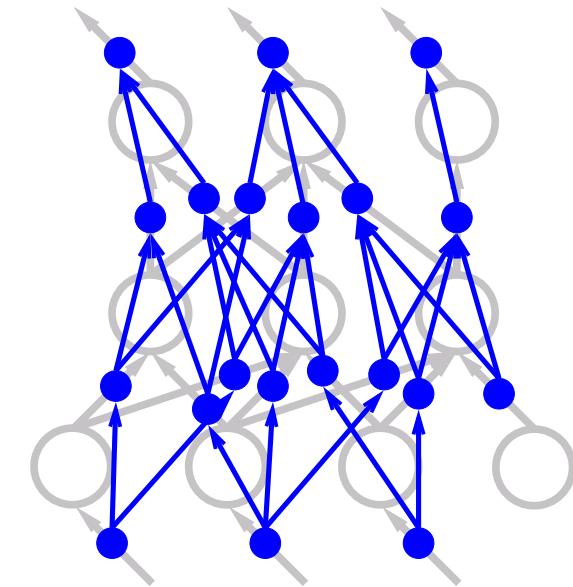

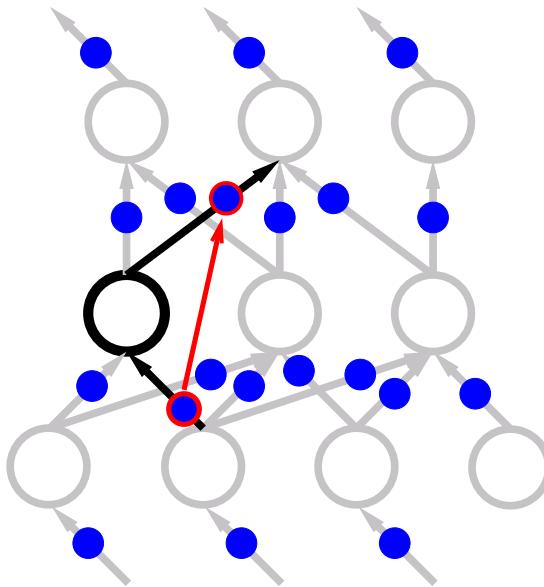

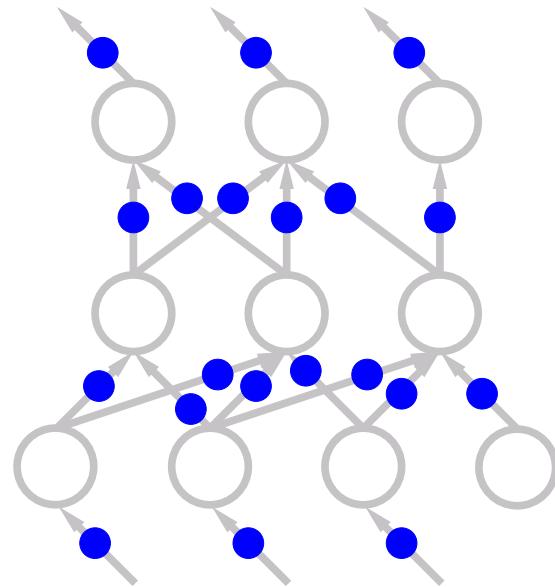

Lyons/Utke

Vanderbilt U / ANL

## absorb 2

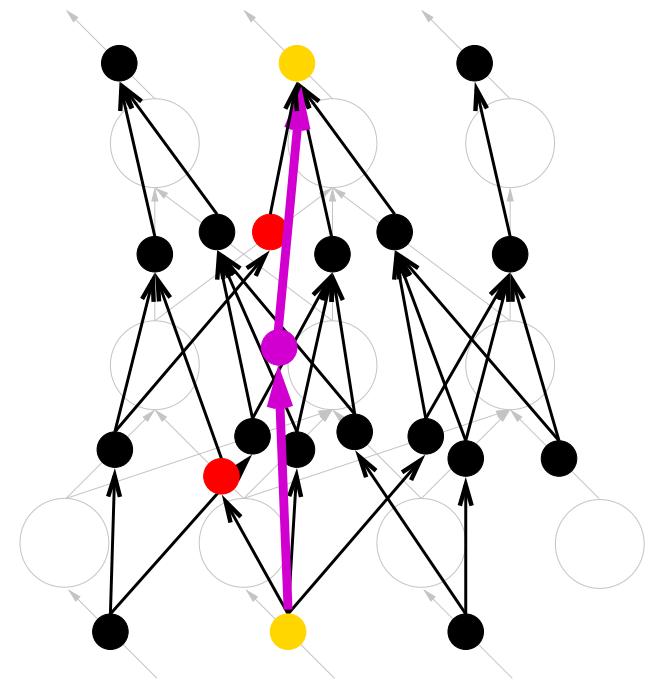

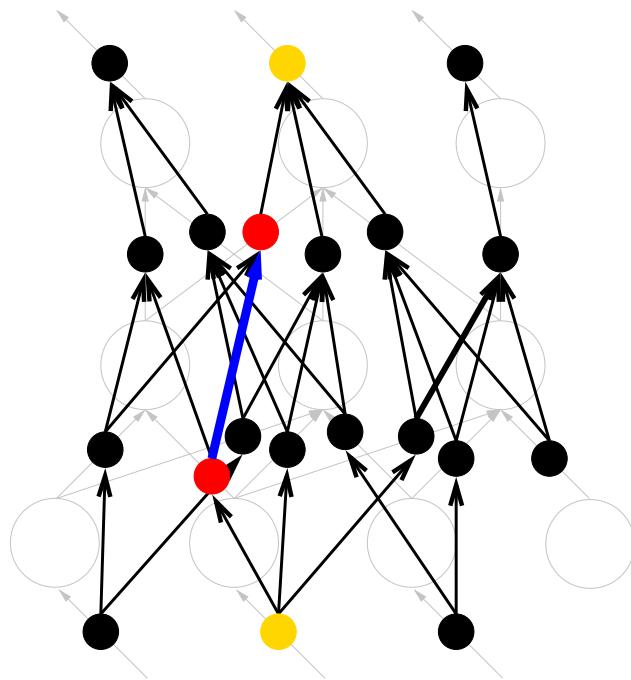

- pick elimination targets such that absorption happens
- J. Pryce (Nov/04): regroup operations  
 $a = a + bc$ ;  $e = e + fg$ ;  $h = h + ij$ ;  $a = a + kl$ ;  $m = m + no$ ;  $a = a + pq$   
 based on the absorbing  $a$  to  $a = a + bc + kl + pq$
- not representable in the computational graph  $\Rightarrow$  directed line graph

mad

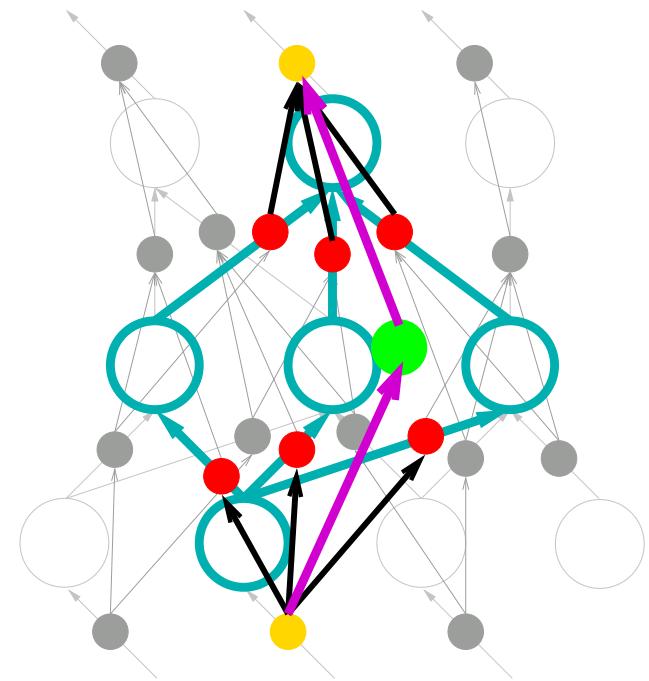

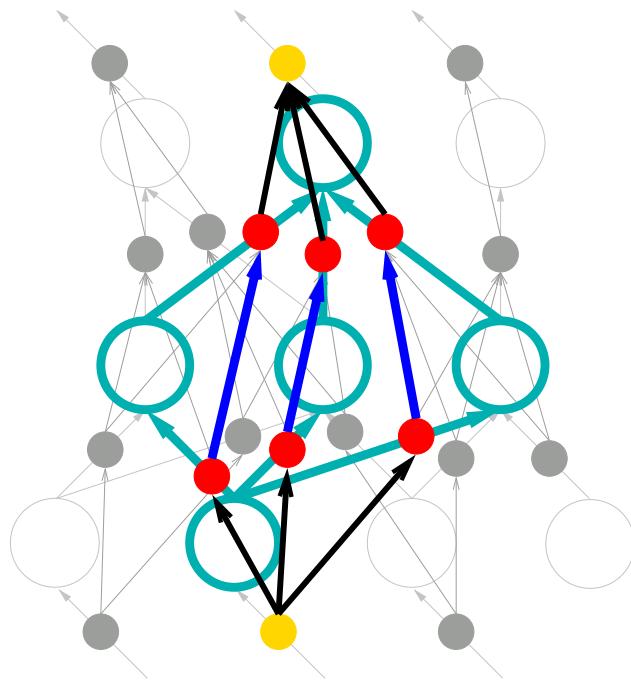

## absorb 3

- pick elimination targets such that absorption happens
- J. Pryce (Nov/04): regroup operations  
 $a = a + bc$ ;  $e = e + fg$ ;  $h = h + ij$ ;  $a = a + kl$ ;  $m = m + no$ ;  $a = a + pq$   
 based on the absorbing  $a$  to  $a = a + bc + kl + pq$
- not representable in the computational graph  $\Rightarrow$  directed line graph

## absorb 4

- pick elimination targets such that absorption happens
- J. Pryce (Nov/04): regroup operations  
 $a = a + bc$ ;  $e = e + fg$ ;  $h = h + ij$ ;  $a = a + kl$ ;  $m = m + no$ ;  $a = a + pq$   
based on the absorbing  $a$  to  $a = a + bc + kl + pq$
- not representable in the computational graph  $\Rightarrow$  directed line graph

## implementation & conclusions

- ACTS project Argonne National Laboratory, MIT, Rice University, RWTH Aachen
  - numerical models (design optimization, chemical engineering, oceanography)
  - transformations: automatic differentiation, interval, ensemble computations (uncertainty estimates)
  - Fortran (C/C++, Matlab, Java)
  - website: [www.mcs.anl.gov/openad](http://www.mcs.anl.gov/openad)
- 
- in adjoint code context effects are smaller than checkpointing / taping improvements
  - data locality heuristics doesn't improve things (compiler gets that part right)
  - op count does improve things (compiler can't improve)
  - late stage improvements, but automated
  - consistent through compiler optimization
  - before final conclusion: more examples, more compilers, constant folding
  - future potential: vector operations

adieu!
